

Hessen Online Traffic Information Services

Vast range of high-quality road user traffic information

Hessen Mobil collects and generates a wide range of highly topical traffic data and traffic information in order to fulfil the core task of a road operator - i.e. to maintain traffic flow and ensure traffic safety through efficient traffic management.

With the Hessen Online Traffic Information Services, Hessen Mobil is making this broad spectrum of high-quality traffic data and information available to all interested road users, online in a new, visually attractive format since May 2016.

Visit the service on
www.verkehrsservice.hessen.de

The following information is already available today:

- Traffic messages (traffic jams and closures)
- Short-term roadworks (live tracking)
- Long-term roadworks in field of responsibility of Hessen Mobil (current and future)
- 33 traffic cameras (short video sequences of webcams at important decision points)
- Parking spaces and rest areas (static information on location and type of facility)
- Free parking spaces for trucks (dynamic information on currently available truck parking spaces)

In addition, information on the predicted traffic situation (30 min trend), e-charging stations and route recommendations will be added to the service during 2018.

- Verkehrsmeldungen
- Tagesbaustellen
- Dauerbaustellen
- Zukünftige Dauerbaustellen
- Verkehrskameras
- Parkplätze und Rastanlagen
- Freie Parkplätze für LKW
- Listensicht

Improved user experience

The information is primarily displayed on a map, but users also have the option of having all data displayed in the form of a list.

The traffic service is responsive. The display adapts optimally to any terminal device, be it a smartphone, a PC at home or a tablet. The service is always opened via the browser, so the additional installation of an app is not necessary.

A novelty is the personal user area, where users can create their own routes and set up a push notification for these. This way, messages about their own route can be sent directly to their smartphone.

Current and highly accurate information make the difference

With the Hessen Online Traffic Services, Hessen Mobil offers first-hand traffic data. The traffic control centre originally records the traffic situation on the entire Hessian motorway network and on important Federal highways and uses this data to generate further information that can now be made available online with low latency. In addition to the quality factor, the wide range of traffic information is a decisive advantage over other services of this kind. For example, the short-term roadworks located live or information on long-term roadworks are information that was originally collected/generated by Hessen Mobil and is not available to any other service provider in this form.

In short: all relevant traffic information at first hand - that is the big plus of the Hessen Online Traffic Services.
